Gapop 10.0, Gapext 0.5

Searched: 93435 seqs, 34255486 residues

Total number of hits satisfying chosen parameters: 93435

Minimum DB seq length: 0
Maximum Match 0%
Maximum Match 100%
Listing first 45 summaries
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. ENDOPLASMIC SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. ENDOPLASMIC RETICULUM (PROBABLE).

DOMAIN: THE HISTIDINE BOX DOMAINS MAY CONTAIN THE ACTIVE SITE DOMAIN: THE HISTIDINE BOX DOMAINS MAY CONTAIN THE ACTIVE SITE AND/OR BE INVOLVED IN METAL ION BINDING.

SIMILARITY: BELONGS TO THE FATTY ACID DESATURASE FAMILY.

SIMILARITY: CONTAINS A CYTOCHROME B5 FAMILY, HEME-BINDING DOMAIN.

PATHWAY: POLYUNSATURATED FATTY ACID BIOSYNTHESIS.

SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM.

SUBCELLULAR LOCATIONE BOX DOMAINS MAY CONTAIN THE ACTIVE SITE DOMAIN: THE HISTIDINE BOX DOMAINS MAY CONTAIN THE ACTIVE SITE AND/ OR BE INVOLVED IN METAL ION BINDING.

SIMILARITY: TO OTHER PLANT OMEGA-3 FATTY ACID DESATURASES.
                                                                                                                                                                                                                                                                                                                                 55

                           The present sequence represents a peptide derived from a desaturase enzyme. The specification describes methods for desaturating a fatty acid and for producing a desaturated fatty acid by expressing increased levels of a desaturase. Desaturases can be used for desaturating fatty acids. The enzymes can be used to produce polyunsaturated fatty acids, which can be used for treating malnutring polyunsaturated fatty acids, which can be used for treating malnutring the produce polyunsaturated fatty acids, which can be used for treating malnutring the produce polyunsaturated fatty acids, which can be used for treating malnutring the produce polyunsaturated fatty acids, which can be used for treating malnutring the produce polyunsaturated fatty acids, which can be used for treating malnutring the produce produce polyunsaturated fatty acids, which can be used for treating malnutring the produce pro

They can also be used to inhibit platelet aggregation, cause vasodilation, lower cholesterol levels, inhibit proliferation of vessel wall smooth muscle and fibrous tissue, reduce or prevent gastro-intestinal bleeding and other side effects caused by non-steroidal anti-inflammatory drugs, prevent or treat endometriosis and premenstrual syndrome, treat myalgic encephalomyelitis and chronic fatigue after viral infections, treat AIDS, multiple sclerosis, acute respiratory syndrome, hypertension and inflammatory skin disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

CC desaturase enzyme. The enzyme sequence is used in the methods of the invention. The specification describes methods for desaturating a CC fatty acid and for producing a desaturated fatty acid by expressing CC increased levels of a desaturase. The present desaturase is an enzyme CC which introduces a double bond carbons 6 and 7 from the carboxyl end of CC a fatty acid molecule. The enzyme can be used for desaturated fatty acids. The enzyme can be used for treating malnutrition, in pharmaceutical CC compositions, in cosmetics or in animal feed. The polyunsaturated fatty acids can be used for treating e.g. restenosis after angioplasty, CC inflammation, rheumatoid arthritis, asthma, psoriasis, cancer, diabetes or eczema or reduce blood pressure. They can also be used to inhibit platelet aggregation, cause vasodilation, lower cholesterol level:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT

Fragments of the DNA are used as probes to isolate related coding sequences. Recombinant plants can produce high yields of PUFA, since new pathways can be created and unwanted ones suppressed. Plants can be engineered to express oils of particular PUFA composition, e.g. one similar to that in human milk, and product recovery is simpler

```

The present sequence represents a fatty acid delta-6 desaturase enzyme. The specification describes methods for desaturating a fatty acid and for producing a desaturated fatty acid by expressing increased levels o a desaturase. The present desaturase is an enzyme which introduces a

of.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           double bond carbons 6 and 7 from the carboxyl end of a fatty acid molecule. The enzyme can be used for desaturating fatty acids. The enzyme can be used to produce polyunsaturated fatty acids, which can be used for treating malnutrition, in pharmaceutical compositions, in cosmetics or in animal feed. The polyunsaturated fatty acids can be used for treating e.g. restenosis after angioplasty, inflammation, rheumatoid arthritis, asthma, psoriasis, cancer, diabetes or eczema or reduce blood pressure. They can also be used to inhibit platelet aggregation, cause vasodilation, lower cholesterol levels, inhibit proliferation of vessel wall smooth muscle and fibrous tissue, reduce or prevent gastro-intestinal bleeding and other side effects caused by non-steroidal anti-inflammatory drugs, prevent or treat endometriosis and premenstrual syndrome, treat myalgic encephalomyelitis and chronic fatigue after viral infections, treat myalgic encephalomyelitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            residues 50-53, 39-43, 172-176, 204-213, or 390-402 of delta-5 desaturase (AAY9560) or comprising delta-12 desaturase (AAY9560) are claimed. Oil and fatty acids (especially gamma-linolenic acid) isolated from the recombinant insect cells are also claimed. Production of polyunsaturated long chain fatty acids (PUFAs) in insect cells has many advantages, as insect cells have greatly simplified lipid compositions, are not subject to external variable fluctuations, and can easily be maintained and manipulated. The oils are used in pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              compositions, infant formulas, dietary supplements or substitutes, and cosmetics (all claimed). The PUFA supplements have antiinflammatory, antirheumatic, antiasthmatic, antipsoriattic, osteopathic, cytostatic, antidiabetic, dermatological, gynecological, anti-HIV, neuroprotective,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acid to linoleic acid, linoleic acid to gamma-linolenic acid or of alpha-linolenic acid to stearidonic acid. Transgenic insect cells comprising a nucleotide sequence which encodes a polypeptide compr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence corresponds to a fungal delta6-desaturase whose coding sequence is an example of a nucleic acid sequence used to transform the cells. The essential FAs obtained can be used in nutritional formulations or animal feed formulations. The long chain PFAs can be used in nutritional feed formulations. The products can also be used for productly transgenic animals which can be used for producing transgenic animals which can be used for producing essential FAs which can be used for products such as leukotrienes, thromboxanes, arachidonic acid, elcosapentaenoic acid or docosahexaenoic acid. The products can also be used in cell culture. The animal or milk fat produced can be administered
                                                                                                                                                                                                                                                                                      New compositions comprising cells that express desaturases and elongases, for synthesizing essential fatty acids or long-chain polyunsaturated fatty acids, used in nutritional, cosmetic or are feed formulations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    delta6 desaturase; desaturase gene; elongase gene; fatty acid; elcosanold; nutrition; infant formula; dietary supplement;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB31684 standard; Protein; 457 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of generating novel compositions comprising animal cells producing essential fatty acids (FAs). The animal cells are produced by transforming cells, e.g. embryonic stem cells, with nucleic acid encoding heterologous enzymes involved in fatty acid, e.g. long chain or polyunsaturated fatty acid (PFA) biosynthesis.
